CT Scan uses harmful x-rays ( the form of electromagnetic radiation like light) for imaging, while MRI does not use any radiation and is based on the effect of the magnetic field, radio waves for the imaging of the organs of the body. CT Scan gives the images of the bones in a much-sophisticated way than the x-ray and is good to check the fractures, tumors, and arthritis but MRI which is popular in detecting the damage of soft tissue.

In a single scan, body CT can evaluate bone, soft tissue, and blood vessels. Unlike MRI, if you have metal in your body (shrapnel, bullets, needles, etc.) or an implanted medical device, you can still have a body CT since no magnets are used in the procedure.

Body CT - ARA Diagnostic Imaging

This method displays the anatomical detail of blood vessels more precisely than magnetic resonance imaging (MRI) or ultrasound. Today, many patients can undergo CTA in place of a conventional catheter angiogram , a minor procedure during which a catheter is passed through the blood vessels all the way to the heart, however CCTA has not fully replaced this procedure.
