Elementary Differential Equations, 11 th Edition is written from the viewpoint of the applied mathematician, whose interest in differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a ...

The differential equation can be written as $y' + P(x)y = Q(x)$. Integrating both sides of the equation, we obtain $y + \int P(x)y dx = \int Q(x) dx + C$. Imposing the given initial condition, the specific solution is $y = e^{-\int P(x) dx} \left(\int Q(x) e^{\int P(x) dx} dx + C \right)$. Therefore, $y = e^{-\int P(x) dx} \left(\int Q(x) e^{\int P(x) dx} dx + C \right)$. Observe that the solution is defined as long as $e^{\int P(x) dx} \neq 0$. It is easy to see that $e^{\int P(x) dx} > 0$ for all x .
